PROFILE

Flutter Developer with 4+ years of experience building scalable, production-grade mobile applications for Android and iOS. Specialized in Clean Architecture, modular systems, BLoC and Riverpod state management, offline-first solutions, POS integrations, and multi-role enterprise platforms.

Open to remote Flutter development opportunities, collaborative teams, and product-focused mobile app work with strong architecture and polished UI. Proven track record of leading full development lifecycles from requirements analysis to deployment, with experience across POS, fintech, healthcare, education, networking, logistics, SaaS, and backend-integrated products.

PROFESSIONAL EXPERIENCE

- Flutter Developer (Remote) — TelNova**

01/2026 – 05/2026

 - enterprise-grade modular apps
 - scalable multi-role systems
 - offline-first and optimized API integration
 - backend service collaboration
 - Odoo and Clover integrations
 - Odoo customization to solve service problems
- Flutter Developer (Sole Developer) — Innovation Stars**

03/2025 – 12/2025

 - Led development of POS, parking, healthcare & business apps.
 - Built QR, Bluetooth printing, and role-based systems.
- Flutter Developer — Simple Galaxy**

2024 – 2025

 - Developed scalable cross-platform applications using Flutter & Firebase.
- Freelance Flutter Developer**

2022 – 2024

 - Delivered apps in car rental, POS, marketplace, and education sectors.

EDUCATION

Beni Suef University
B.Sc. Computer Science

2020 – 2023

SKILLS

- | | | | |
|-----------------------|--------------------------------------|----------------------------|-------------------------|
| • Flutter | • Dart | • iOS | • Android |
| • Java | • Kotlin | • Swift | • Python |
| • SQL | • C++ | • SQL | • GitHub |
| • Git | • CI/CD | • Firebase | • Hive |
| • SQLite | • Supabase | • BLoC | • Riverpod |
| • Cubit | • Provider | • GetX | • Odoo |
| • RESTful APIs | • Docker | • WebSockets | • WebSockets |
| • Redis | • MongoDB | • Responsive UI | • Clean Architecture |
| • MVVM | • SOLID | • Performance optimization | • Debugging |
| • QR/NFC integrations | • Bluetooth and network POS printing | • Offline-first systems | • Offline-first systems |

PROJECTS

DrDrugJo | Medical Reference Platform

- Contributed to a healthcare reference and learning platform serving medical professionals through a combination of structured drug information, educational content, assessment flows, and professional updates.
- Worked on a multi-section experience that had to balance content discoverability, reference credibility, quiz interactions, certificates, progress tracking, and notification-driven engagement.
- Helped build a product that combines reference utility with learning and career-oriented features, making the architecture and UX more layered than a single-purpose content app.
- **Technologies:** Flutter, Firebase, medical content architecture, quiz system, progress tracking, multi-section application design, notifications, reference-oriented search and browsing
- Google Play 
- App Store 

Invotek | E-Invoicing System

- Worked on a business-critical e-invoicing and management platform where compliance, permission boundaries, reporting clarity, and transaction accuracy all mattered to the product experience.
- Contributed to invoicing flows, customer and product management, expense tracking, dashboard reporting, bilingual support, invoice printing, and permission-aware user experiences across different business roles.
- Supported integration-driven workflows tied to the Jordanian National Invoicing System (Fatoorah), which added real-world constraints beyond standard mobile feature delivery.
- **Technologies:** Flutter, BLoC, e-invoicing workflows, Fatoorah integration, permission system, bilingual UI, dashboard reporting, customer and inventory tooling, Bluetooth and thermal printing

Wafy-App | Restaurant POS

- Built a restaurant and cafe POS product designed for high-pressure operational environments where speed, accuracy, and clear cashier workflows directly affect business throughput.
- Implemented table management, order merging and transfer, menu configuration with sizes and toppings, ticket lifecycle handling, receipt printing, live table status, and daily/monthly reporting flows.
- Worked on complex business logic around role-based permissions, Arabic RTL UX, partial offline behavior, and state-driven operational screens that needed to stay fast and predictable during active service hours.
- Positioned the app as more than a CRUD product by supporting real restaurant workflows, multi-step cashier actions, and hardware-connected execution paths.
- **Technologies:** Flutter, Riverpod, Hive, local persistence, invoice workflows, Bluetooth printing, network printing, Arabic RTL UI, role-based access, reporting dashboards, POS-oriented interaction design

Barkin Al-Wafi | Smart Parking Solution

QR-based smart parking with POS printing.

- Built a field-focused parking operations app for guards and supervisors where the product had to support quick decisions, minimal friction, and reliable invoice handling in real-world usage conditions.
- Delivered shift management, opening and closing balance tracking, parking invoice generation, fixed and hourly pricing logic, QR-based invoice completion, and portable printer support.
- Helped shape a workflow-heavy mobile experience that combines operational speed, live sales visibility, and device-assisted execution rather than a simple static form-based app.
- **Technologies:** Flutter, QR code scanning, Bluetooth POS printing, shift management, dynamic pricing logic, real-time statistics, invoice lifecycle handling, operational workflow design

Cater Station (SaaS Platform)

Multi-role event & catering system with booking, payouts, and role dashboards.

- Built product flows for a multi-role SaaS platform serving event and catering operations, where different users needed clearly separated workflows, dashboards, and business responsibilities inside one product.
- Worked on booking operations, payout-related experiences, and role-aware product behavior while keeping the application structure scalable enough for cross-role growth.
- **Technologies:** Flutter, Clean Architecture, role-based systems, multi-dashboard UX, booking workflows, payout-related flows, scalable product structuring

Halla App | Smart Networking

- Built a smart networking app aimed at modernizing how users exchange and manage professional identity, with a stronger emphasis on connected product behavior than basic profile sharing.
- Implemented QR sharing, NFC exchange, AI-generated job tags, offline/local persistence, and cloud synchronization flows that improved discoverability and practical contact reuse.
- Worked on a product that blended mobile UX, device capabilities, and intelligent profile enrichment into one cohesive networking experience.

- Technologies: Flutter, Firebase, Hive, AI-assisted tagging, NFC, QR workflows, BLoC, Clean Architecture, offline/cloud sync, profile discovery patterns

Wasla App | Graduation Project

- Built a delivery collaboration product that connects buyers with travelers, turning a multi-party coordination problem into a mobile-first experience with messaging, payments, and request flow management.
- Implemented secure chat, Paymob integration, and NLP-supported product behavior to improve how users coordinate purchases and deliveries across cities.
- The project demonstrated practical handling of marketplace-style communication, payment-linked flows, and real-time product coordination patterns.
- Technologies: Flutter, Firebase, Hive, Paymob API, NLP features, BLoC, chat workflows, marketplace-style coordination, mobile transaction flows

Taagira App | Car Rental App

- Built a car rental platform from scratch with user flows for browsing, listing, and renting vehicles, centered around clarity, trust, and discoverability.
- Implemented secure authentication, location-based search, and scalable mobile user journeys designed to support both customers and vehicle owners in one platform.
- Helped shape a product where search relevance, trust-oriented flow design, and multi-path usage mattered as much as the raw feature checklist.
- Technologies: Flutter, Firebase, Firestore, Hive, BLoC, geolocation, authentication flows, marketplace UX, listing and rental workflows

V-School App | Education Management

- Worked on an education management platform designed to simplify daily teacher operations through connected lesson, attendance, and assignment workflows.
- Helped build real-time educational product behavior where updates, organization, and workflow continuity were important to classroom-facing usage.
- Technologies: Flutter, MVVM, RESTful APIs, Firebase, attendance workflows, assignment handling, teacher productivity flows, real-time synchronization

Koolyum | Backend Engineer

Universal POS Bridge and AI Online Ordering Workflow

Koolyum is a multi-service backend platform built for AI-assisted online ordering, tenant-aware POS integration, guest checkout, and operational order management.

My Role

My role focused on shaping backend-connected flows that link ordering, checkout, workflow handling, and provider integration into one dependable system. I worked on service contracts, order lifecycle behavior, AI-supported cart flow, and live update patterns that made the ecosystem usable from both the customer-facing side and the internal operations side.

Contribution Highlights

- Designed or extended tenant-scoped API contracts and provider resolution flows across the bridge layer.
- Worked on MongoDB-backed order workflow records with guarded state transitions, retry eligibility, and safe provider creation rules.
- Supported checkout cart APIs and AI sync behavior using chatroom_id plus full item payload persistence.
- Connected WebSocket event flows so cart and workflow clients can receive live updates without repeated polling.
- Integrated source-backed service behavior into one backend story spanning ordering, provisioning, Odoo tenant scope, and vector search.

Architecture Notes

- Public integration is tenant-scoped through X-API-Key and X-Tenant-Id instead of exposing provider credentials to clients.
- The bridge separates direct provider order creation from local MongoDB workflow resources so operational state stays under internal control.
- Guest checkout carts are stored independently from orders_events and are identified by chatroom_id for AI and frontend reuse.
- Redis is used for cache and synchronization behavior, while MongoDB stores workflow and cart records.
- The provisioning service is admin/internal oriented and guarded by feature flags.
- The custom Odoo layer enforces tenant/company scope and publishes product changes to the AI and embedding pipeline.

Technologies

Python, FastAPI, MongoDB, Redis, WebSockets, Qdrant, Docker, Node.js, Express, Mongoose, Odoo, Traefik, Multi-tenant Architecture, POS Integration, API Design, Workflow and State Machine Design
